UFL
uniting future legends

High Performance Sports Apparel of the Future

Uniting Future Legends (UFL) is a new urban active wear brand, created by Singapore based veteran apparel manufacturer, Alpine Creations, to celebrate the journey of competitive armature athletes who aspire to become tomorrow's sports legends.

Investing in the Stars of the Future

UFL supports the Faldo Series Asia, where elite amateur golfers Rory McIlroy, Nick Doughetry and LPGA champion Yani Tseng have launched their professional careers. Sir Nick, a six-time Major champion, said: "Faldo Series Asia competitors have had a unique opportunity to help develop a line of clothes that they and their peers are now wearing. We thank UFL for its support of the Series and welcome this level of collaboration between our partners and our players.

High Performance does not mean High Price

Ashok Mahtani, co-founder of UFL and Alpine Creations, said "UFL has the unique ability to bring high performance, cutting-edge and eco-friendly fabrics to sportswear, due to Alpine's three decades of apparel manufacturing experience and partnerships with some of the world's largest textile mills."

Alpine's experience in having produced over 400 million garments over the years, and its credible reputation in the industry provides UFL with the ability to deliver a high end, luxury product at a fair price to its consumers.

Even though UFL brings top-of-the-line product, it does not compromise on its strict code of conduct and ethical standards throughout the entire manufacturing process.

Cutting Edge and Eco Friendly fabrics of the future

The umpires' shirts are manufactured using Moistex™, an innovative fabric from Japan, made from recovered cotton waste, which is knitted on the underside of the fabric for a cooling and soft touch to the skin. While, a moisture wicking yarn is used on the fabric surface, which moves sweat away from the body.

One would wonder why the ground staff have been provided with black shirts in the hot, tropical climate of Singapore. Guess what? This black fabric, termed Cold Black® by Schoeller, is treated with a unique chemical from Switzerland, which possesses a special finishing technology for textiles that reduces heat build-up on dark fabrics. The wearer will benefit from reliable protection from UV rays, and heating up due to sunlight.

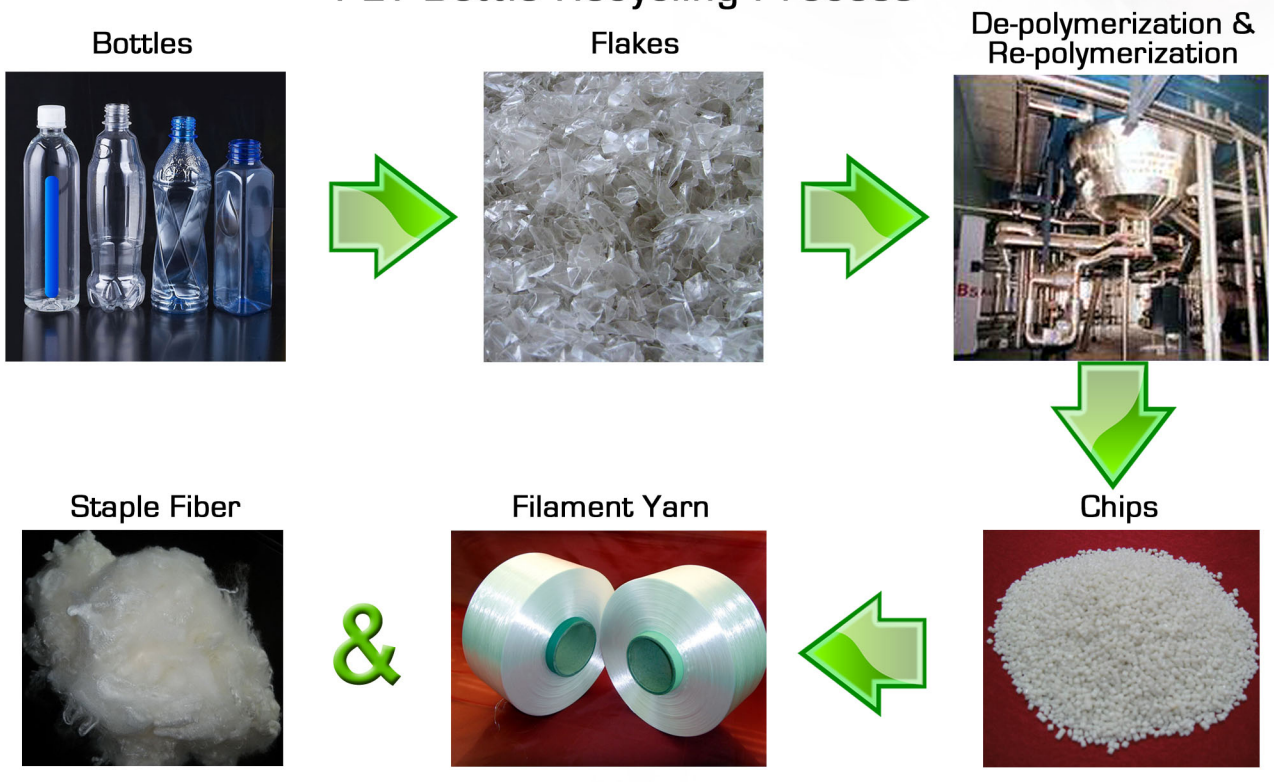
"UFL has the unique ability to bring high performance, cutting-edge and eco-friendly fabrics to sportswear, due to Alpine's three decades of apparel manufacturing experience and partnerships with some of the world's largest textile mills."

- Ashok Mahtani

Did you ever realize that fabrics could actually be derived from corn? UFL will be providing an innovative fabric, Sorona® Flycool, to this years scorers. Sorona, by DuPont™, is produced from corn, a renewably sourced fiber, which has an extremely soft hand and natural stain resistant properties. This is blended with nylon flycool yarn, to provide a cool touch to the skin, while also wicking moisture away from the body.

Another 21st Century innovation is the use of recycled plastic bottles and converting them into polyester yarn, which would otherwise end up in landfills as waste. UFL will be providing the officials' and womens' tournament merchandise in this eco-friendly polyester yarn, which also has moisture wicking and odor absorbing properties.

PET Bottle Recycling Process



Tournament merchandise for men will also be manufactured from an eco-friendly material called Bamboo Charcoal, created from recycled bamboo material. The bamboo is cut into small pieces and kept in a vacuum furnace at 850 degrees Celsius for three weeks to turn it into bamboo charcoal. Bamboo charcoal is also used to eliminate smells. Apart from being eco friendly, the apparel have deororizing and moisture wicking attributes which is a natural property of this fiber.
